

BENS CarbonCopy Configurator

BENS CarbonCopy Configurator is a free Windows program from Suchy MIPS GmbH that supports BENS users when creating configurations for the BENS CarbonCopy Filter.

The configuration determines the kind of operation of the BENS CarbonCopy Filter.

The following statements can be made:

The kind of copy (carbon 1-1-1 2-2-2 3-3-3... or bundle 1-2-3 1-2-3 1-2-3...)

Number of copies

Paper Tray for page or copy

Media size for page or copy

Media type for page or copy

Output bin for page or copy

Orientation of page or copy

Duplex/Simplex print for pages or copies

Horizontal and vertical offset per page.

There are options "no change" and "don't use" for all page attributes available.

If the option "no change" was selected, the original attribute value will be left as it was in the print file. If the option "don't use" was selected, all existing attributes of the chosen type will be deleted from the input file.

With an appropriate definition in the configurator of the CarbonCopy Filter can be made to insert additional PJJL commands (for example, for stapling the pages) in the PJJL header of the print data.
