BENS Prescribe2PCL Filter

The BENS Prescribe2PCL filter on-the-fly converts PRESCRIBE print data into PCL print data, so that business documents, that were so far put out on PRESCRIBE printing devices (mostly Kyocera printers), can now be put out on standard industrial printers (PCL) without any changes. The filter has a specific property: it offers a parameterisation via an XML-file which enables several additional controls that normally have to be made via the printer control panel (printer panel simulation), for example settings for the default font type, tray control, etc.

A unique characteristic of the PRESCRIBE2PCL filters is that, with the aid of configuration parameters, the printout can be affected, e.g. by an horizontal or vertical offset.
