PCL MacroGenerator Enterprise

The Suchy MIPS program PCL MacroGenerator Enterprise transforms files from the XPS format into PCL5 and PCL6 macros. Apart from the document format XPS, the following graphic formats are also supported: BMP, JPG, PNG and TIFF. Monochrome and colour templates are supported as well.

The support of the XPS formats enables creating templates with a freely chosen programme, as Windows directly supports the XPS format. For example, to create an XPS file, the Microsoft XPS Document Writer can be used, that is available as a free printer driver for users of Windows 7/8 and Windows XP. This way, print templates can be created and administrated with Microsoft Office programmes such as Word, Excel, PowerPoint etc. but also with programmes of other manufacturers.

The XPS format is chiefly suited for full-page document templates such as letter templates or forms. The graphic formats, on the other hand, are better suited for sub objects such as logos, signatures etc. Sub objects can also be cut from full-page XPS templates.

The PCL MacroGenerator Enterprise is equipped with a comfortable, intuitive and easy-to-operate user interface. It was programmed to be used everywhere as no installation of the programme is necessary: a double click on the EXE file starts the programme.

Several different files with varying formats can be converted simultaneously into PCL macros. All source and macro files are administrated as a single project in one separate directory.

Additionally, the programme is equipped with a macro test option and with tools with which the positioning of the macros can subsequently be changed, colour options can be determined and transparency options can be set.

The PCL MacroGenerator Enterprise can create monochrome as well as colour macros in the PCL5 and PCL6 format.
