

BENS Barcode Filter

The BENS Barcode Filter enables the printing of barcodes on every PCL printer, without this printer having to be equipped with specific hardware options. The filter is uploaded only once. The number of usable terminal devices is determined by a license file that also has to be uploaded. Further licenses can always be ordered and uploaded on the BENS server.

The BENS barcode filter is HP-compatible, meaning it recognizes standardised PCL-commands for barcodes and converts these into compressed barcode graphics before the print data are transferred to the target device.

SAP PCL print data with barcodes are processed by BENS without any faults and without necessitating interference into the SAP system (Plug&Play).
