BENS

MergeJobs Filter

BENS MergeJobs Filter

The BENS MergeJobs filter migrates several print jobs from a spool file into one connected print job. This entails that the user can, for example, collect one large job from the electronic box of a printer instead on many small jobs. The print jobs can differ regarding paper size and simplex/duplex control, however, have to be at all times printed and created with the same printer driver and colour settings. In the present form, the filter is only suitable for PCL6 files.
