

## BENS Unicode Filter

The BENS Unicode filter enables the printing of UTF-8-encoded data on PCL printers that are not Unicode-enabled or have no suitable UTF-8 fonts. Included in the delivery is, apart from the filter, the monotype font „Andale“ with over 65,000 characters (e.g. Russian, Chinese, Japanese, etc.) in medium/bold/italic/bold-italic, so that for example printouts of Unicode-based SAP systems will run without any problems (Plug&Play).

The BENS Unicode filter is compatible to the HP International Printing Solution (IPS) and Lexmark International Printing (IP). It is very cost-effective, because - contrary to many other products - it operates entirely without equipping the printers with additional hardware for the storage of fonts.
