BENS

Universal-Exchanger

Universal Filter

The BENS Universal Filter provides a complex search and replace function for print data of various types. The filter has the following characteristics:

- several search and replacement functions can be defined simultaneously.

- There is a syntax for searching and replacing non-printable characters, e.g. the escape

- the search and replace function can be defined in hexadecimal mode

- an optional delete function deletes the searched characters

- placeholders are supported

- a PJL header can be added to the PCL5 print data stream

- an existing PJL header can be supplemented with new PJL commands

- PJL commands can be deleted from an existing PJL header

- From LPR protocol data the variables USERNAME, HOST, JOBNAME and JOBDATE can be read out and inserted into the PJL header.Example: @PJL SET USER = „USERNAME"

- an automatic function adds a PJL header, if none exists.
